

PROActiv Health

How clean is the air in your building?

-  **People spend 90% of their time indoors, on average** – at work, home, school or even the supermarket.
-  **While indoors, do you ever think about the quality of air you're breathing?** You should. It has a direct impact on your health and cognitive functioning.
-  **All air contains pollutants** from dust, dirt and mould particles to various chemicals. But it's the pollutant type – and density – that matters. Some are dangerous, while others can make you drowsy, but in most cases only excessive exposure will cause adverse effects.
-  **PROActiv Health will help keep your indoor spaces safe and productive through advanced air quality monitoring.**

How does PROActiv Health work?

PROActiv Health is essentially a smart, digitally connected sensor, which integrates into your BEMS.

By remotely monitoring airborne chemicals and particles, and even examining air temperature and humidity, it checks whether indoor spaces are fit for purpose.

It gathers in-depth real-time data, which is then fed into a smart digital interface. This allows you to:

- View, compare and export air quality insights from a user friendly dashboard
- Identify areas that require attention/further investigation. This can be anything from low air flow to targeting the cause (and subsequent resolution) of low indoor air quality.

What will PROActiv Health do for you?

A comfortable building = happy occupants
Allow your building to breathe. Working with your Building Energy Management System (BEMS), PROActiv Health circulates fresh air throughout the day. Raised oxygen levels give occupants a natural energy boost and dilute air pollutants, keeping them at comfortable levels.

Prevent the spread of viruses
At high levels, air pollutants can negatively impact health and some even facilitate the spread of viruses. Monitoring these particles can help prevent airborne illnesses being transmitted. Following the Covid-19 lockdown, this has become increasingly important.

Keep an eye on occupancy thresholds
Too many people in your building? If occupancy thresholds exceed a safe level, you'll be alerted.

Boost productivity and engagement
Keep airborne chemicals and particles, as well as air temperature and humidity, at targeted set points. The result? Productive and engaged occupants. Studies have shown that test scores improve by 12% in low CO2 environments and employees' work 60% faster.

Keep everyone in your building safe
If anything suspicious is detected, you'll be alerted. Be safe in the knowledge that nothing will 'slip through the net' with PROActiv Health.

Why choose PROActiv Health?

"PROActiv Health is not your standard air quality monitor. It's a premium indoor climate solution with depth and quality at the centre of its design. Its impressive 9-in-1 sensor is wrapped into a wireless package, with two virtual sensors for detecting occupancy levels and virus risk. But it's not just technical prowess that sets PROActiv Health apart from the rest. The support package surrounding this solution is second-to-none."

So, if you want to ensure the wellbeing of your staff, students, tenants or patients, while simultaneously boosting your organisation's productivity, PROActiv Health is a win-win."
